

Claims

- [c1] A device that uses electro-static and magnetic fields to produce motion, comprising of a motivator and a target,
- [c2] A method to induce electric and magnetic fields in said motivator and on said target,
- [c3] A means to induce fields within said target,
- [c4] A means to induce an electric charge within a conductive mass and thereby polarizing said mass,
- [c5] A means of electrically polarizing said conductive mass by burying dielectrically insulated high voltage field emitters within said mass,
- [c6] A means to assist said polarizing charge accumulation with a low voltage field (produced through either magnetically coupling or other means).
- [c7] Whereby the fields induced in said target by said motivator (and possibly aided by other means) will be attracted and/or repelled by said motivator.
